

### Parametric Sparse Sampling and its Applications in Neuroscience and Sensor Networks

Pier Luigi Dragotti

April 24, 20141

<sup>1</sup>This research is supported by European Research Council ERC, project 277800 (RecoSamp)

▲ 同 ▶ ▲ 国 ▶ ▲ 国 ▶

### **Problem Statement**

You are given a class of functions. You have a sampling device. Given the measurements  $y_n = \langle x(t), \varphi(t/T - n) \rangle$ , you want to reconstruct x(t).

Natural questions:

- When is there a one-to-one mapping between x(t) and  $y_n$ ?
- What signals can be sampled and what kernels  $\varphi(t)$  can be used?
- What reconstruction algorithm?

### The Information Acquisition Process

- The lens blurs the image.
- The image is sampled ('pixelized') by the CCD array.
- You want to develop techniques that give you the sharpest and highest possible resolution images given the available acquisition device

### Motivation: Sampling Everywhere

Applications in Neuroscience

### Motivation: Sensor Networks

・ 同 ト ・ ヨ ト ・ ヨ ト

- ▶ The source (phenomenon) is distributed in space and time.
- ► The phenomenon is sampled in space and time.
- How many sensors? How can we localise the diffusion source?

### Motivation: Free Viewpoint Video

Multiple cameras are used to record a scene or an event. Users can freely choose an arbitrary viewpoint for 3D viewing.

This is a multi-dimensional sampling and interpolation problem.

### Outline

- Classical Sampling Formulation and Signals with FRI
- Sampling Kernels and Approximate Strang-Fix Conditions
- From Samples to Signals
- Robust and Universal Sparse Sampling
- Applications in
  - Image Super-Resolution
  - Neuroscience
  - Sensor Networks
- Conclusions and Outlook

▲ 同 ▶ ▲ 国 ▶ ▲ 国 ▶

### **Classical Sampling Formulation**

- Sampling of x(t) is equivalent to projecting x(t) into the shift-invariant subspace V = span{φ(t/T − n)}<sub>n∈ℤ</sub>.
- If  $x(t) \in V$ , perfect reconstruction is possible.
- Reconstruction process is linear:  $\hat{x}(t) = \sum_{n} y_n \varphi(t/T n)$ .
- For bandlimited signals  $\varphi(t) = \operatorname{sinc}(t)$ .

### Nyquist Sampling Rate vs Rate of Information

Here,  $x_1(t)$  and  $x_2(t)$  have the same rate of innovation. However, one discontinuity and no sampling theorems ;-)

### Signals with Finite Rate of Innovation

- The signal x(t) = ∑<sub>n</sub> y<sub>n</sub>φ(t/T − n) is exactly specified by one parameter y<sub>n</sub> every T seconds, x(t) has a finite number ρ = 1/T of degrees of freedom per unit of time.
- In the classical formulation, innovation is uniform. How about signals where the rate of innovation is finite but non-uniform? E.g.
  - Piecewise sinusoidal signals (Frequency Hopping modulation)
  - Pulse position modulation (UWB)
  - Edges in images

#### Signals with Finite Rate of Innovation

Consider a signal of the form:

$$x(t) = \sum_{k \in \mathbb{Z}} \gamma_k \varphi(t - t_k).$$
 (1)

The rate of innovation of x(t) is then defined as

$$\rho = \lim_{\tau \to \infty} \frac{1}{\tau} C_x \left( -\frac{\tau}{2}, \frac{\tau}{2} \right), \tag{2}$$

(日) (同) (三) (三)

where  $C_x(-\tau/2, \tau/2)$  is a function counting the number of free parameters in the interval  $\tau$ .

Definition [VetterliMB:02] A signal with a finite rate of innovation is a signal whose parametric representation is given in (1) and with a finite  $\rho$  as defined in (2).

### Examples of Signals with Finite Rate of Innovation

Filtered Streams of Diracs

**Piecewise Sinusoidal Signals** 

Decaying Exponentials

Mondrian paintings ;-)

### Sampling Kernels

- Given by nature
  - Diffusion equation, Green function. Ex: sensor networks.
- Given by the set-up
  - Designed by somebody else. Ex: Hubble telescope, digital cameras.
- Given by design
  - Pick the best kernel. Ex: engineered systems.

э

### Sampling Kernels

Any kernel  $\varphi(t)$  that can reproduce exponentials:

$$\sum_{n} c_{m,n} \varphi(t-n) = e^{\alpha_m t}, \qquad \alpha_m = \alpha_0 + m\lambda \text{ and } m = 0, 1, ..., L.$$

This includes any composite kernel of the form  $\gamma(t) * \beta_{\vec{\alpha}}(t)$  where  $\beta_{\vec{\alpha}}(t) = \beta_{\alpha_0}(t) * \beta_{\alpha_1}(t) * \dots * \beta_{\alpha_i}(t)$  and  $\beta_{\alpha_i}(t)$  is an Exponential Spline of first order [UnserB:05].

$$eta_lpha(t) \Leftrightarrow \hateta(\omega) = rac{1-e^{lpha-j\omega}}{j\omega-lpha}$$

Notice<sup>.</sup>

- $\triangleright \alpha$  can be complex.
- E-Spline is of compact support.
- E-Spline reduces to the classical polynomial spline when  $\alpha = 0$ . < ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

### Exponential Reproducing Kernels

The E-spline of first order  $\beta_{\alpha_0}(t)$  reproduces the exponential  $e^{\alpha_0 t}$ :

$$\sum_{n} c_{0,n} \beta_{\alpha_0}(t-n) = e^{\alpha_0 t}.$$

In this case  $c_{0,n} = e^{\alpha_0 n}$ . In general,  $c_{m,n} = c_{m,0}e^{\alpha_m n}$ .

A B A A B A

#### Exponential Reproducing Kernels

Here the E-spline is of second order and reproduces the exponential  $e^{\alpha_0 t}$ ,  $e^{\alpha_1 t}$ : with  $\alpha_0 = -0.06$  and  $\alpha_1 = 0.5$ .

### Exponential Reproducing Kernels

- The exponent  $\alpha$  of the E-splines can be complex. This means  $\beta_{\alpha}(t)$  can be a complex function.
- However if pairs of exponents are chosen to be complex conjugate then the spline stays real.
- Example:

$$eta_{lpha_0+j\omega_0}(t)*eta_{lpha_0-j\omega_0}(t) = \left\{egin{array}{cc} rac{\sin \omega_0 t}{\omega_0} e^{lpha_0 t} & 0 \leq t < 1 \ -rac{\sin \omega_0 (t-2)}{\omega_0} e^{lpha_0 t} & 1 \leq t < 2 \ 0 & ext{Otherwise} \end{array}
ight.$$

When  $\alpha_0 = 0$  (i.e., purely imaginary exponents), the spline is called trigonometric spline.

### Exponential Reproducing Kernels

Here  $\vec{\alpha} = (-j\omega_0, j\omega_0)$  and  $\omega_0 = 0.2$ .  $\sum_n c_{n,m}\beta_{\vec{\alpha}}(t-n) = e^{jm\omega_0}$  m = -1, 1. Notice:  $\beta_{\vec{\alpha}}(t)$  is a real function, but the coefficients  $c_{m,n}$  are complex,  $\vec{\alpha} = -1, 1$ .

### Generalised Strang-Fix Conditions

A function  $\varphi(t)$  can reproduce the exponential:

$$e^{j\omega_m t} = \sum_n c_{m,n} \varphi(t-n)$$

if and only if

$$\hat{\varphi}(j\omega_m) \neq 0 \text{ and } \hat{\varphi}(j\omega_m + j2\pi I) = 0 \quad I \in \mathbb{Z} \setminus \{0\}$$

where  $\hat{\varphi}(\cdot)$  is the Fourier transform of  $\varphi(t)$ .

Also note that  $c_{m,n} = c_{m,0}e^{j\omega_m n}$  with  $c_{m,0} = \hat{\varphi}(j\omega_m)^{-1}$ .

< 日 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 > < 0 >

#### Generalised Strang-Fix Conditions

### From Samples to Signals

- Consider any x(t) with t ∈ [0, N) and sampling period T = 1.
- The sampling kernel  $\varphi(t)$  satisfies

$$\sum_{n} c_{m,n} \varphi(t-n) = e^{j\omega_{m}t} \quad m = 1, ..., L,$$

• We want to retrieve x(t), from the samples  $y_n = \langle x(t), \varphi(t-n) \rangle$ , n = 0, 1, ..., N - 1.

ヘロン 人間 とくほど 人間 とう

3

#### From Samples to Signals

We have that

$$s_m = \sum_{n=0}^{N-1} c_{m,n} y_n$$
  
=  $\langle x(t), \sum_{n=0}^{N-1} c_{m,n} \varphi(t-n) \rangle$   
=  $\int_{-\infty}^{\infty} x(t) e^{j\omega_m t} dt, \quad m = 1, ..., L.$ 

• Note that  $s_m$  is the Fourier transform of x(t) evaluated at  $j\omega_m$ .

### From Samples to Signals

- Consider FRI signals which are completely specified by a finite number of free parameters
- ► This is an 'analogue' sparsity model
- For classes of parametrically sparse signals there is a one-to-one mapping between samples and signal:

$$x(t) \Leftrightarrow \hat{x}(j\omega_m) \quad m = 1, 2, ..., L$$

• The number d of degrees of freedom of the signal must satisfy  $d \leq L$ 

A = A A = A

### Sampling Streams of Diracs

- Assume x(t) is a stream of K Diracs on the interval of size N:  $x(t) = \sum_{k=0}^{K-1} x_k \delta(t - t_k), \ t_k \in [0, N).$
- We restrict  $j\omega_m = j\omega_0 + jm\lambda$  m = 1, ..., L and  $L \ge 2K$ .
- We have N samples:  $y_n = \langle x(t), \varphi(t-n) \rangle$ , n = 0, 1, ..., N 1:
- We obtain

$$s_{m} = \sum_{n=0}^{N-1} c_{m,n} y_{n}$$
  
=  $\int_{-\infty}^{\infty} x(t) e^{j\omega_{m}t} dt$ ,  
=  $\sum_{k=0}^{K-1} x_{k} e^{j\omega_{m}t_{k}}$   
=  $\sum_{k=0}^{K-1} \hat{x}_{k} e^{j\lambda mt_{k}} = \sum_{k=0}^{K-1} \hat{x}_{k} u_{k}^{m}$ ,  $m = 1, ..., L$ .

### Prony's Method

The quantity

$$s_m = \sum_{k=0}^{K-1} \hat{x}_k u_k^m, \quad m = 1, ..., L$$

is a sum of exponentials.

▶ Retrieving the locations u<sub>k</sub> and the amplitudes x̂<sub>k</sub> from {s<sub>m</sub>}<sup>L</sup><sub>m=1</sub> is a classical problem in spectral estimation and was first solved by Gaspard de Prony in 1795.

• Given the pairs  $\{u_k, \hat{x}_k\}$ , then  $t_k = (\ln u_k)/\lambda$  and  $x_k = \hat{x}_k/e^{\alpha_0 t_k}$ .

### Overview of Prony's Method

Assume:  $y_n = \sum_{k=0}^{K-1} \alpha_k u_k^m$  and consider the polynomial:

$$P(x) = \prod_{k=1}^{K} (x - u_k) = x^{K} + h_1 x^{K-1} + h_2 x^{K-2} + \ldots + h_{K-1} x + h_K.$$

It is easy to verify that

$$y_{n+K} + h_1 y_{n+K-1} + h_2 y_{n+K-2} + \ldots + h_K y_n = \sum_{1 \le k \le K} \alpha_k u_k^n P(u_k) = 0.$$

In matrix-vector form for indices n such that  $\ell \leq n < \ell + K$ , we get

$$\begin{bmatrix} y_{\ell+K} & y_{\ell+K-1} & \cdots & y_{\ell} \\ y_{\ell+K+1} & y_{\ell+K} & \cdots & y_{\ell+1} \\ \vdots & \ddots & \ddots & \vdots \\ y_{\ell+2K-2} & \ddots & \ddots & \vdots \\ y_{\ell+2K-1} & y_{\ell+2K-2} & \cdots & y_{\ell+K-1} \end{bmatrix} \begin{bmatrix} 1 \\ h_1 \\ h_2 \\ \vdots \\ h_K \end{bmatrix} = \mathbf{T}_{K,\ell} \mathbf{h} = \mathbf{0}$$

э

Pier Luigi Dragotti Parametric Sparse Sampling and its Applications in Neuroscience and Sensor Networks

### Overview of Prony's Method

The vector of polynomial coefficients  $\mathbf{h} = [1, h_1, ..., h_K]^T$  is in the null space of  $\mathbf{T}_{K,\ell}$ . Moreover,  $\mathbf{T}_{K,\ell}$  has size  $K \times (K+1)$  and has full row rank when the  $u_k$ 's are distinct. Therefore  $\mathbf{h}$  is unique.

Prony's method summary:

- 1. Given the input  $y_n$ , build the Toeplitz matrix  $\mathbf{T}_{K,\ell}$  and solve for **h**. This can be achieved by taking the SVD of  $\mathbf{T}_{K,\ell}$ .
- 2. Find the roots of  $P(x) = 1 + \sum_{n=1}^{K} h_k x^{K-k}$ . These roots are exactly the exponentials  $\{u_k\}_{k=0}^{K-1}$ .
- 3. Given the  $\{u_k\}_{k=0}^{K-1}$ , find the corresponding amplitudes  $\{\alpha_k\}_{k=0}^{K-1}$  by solving K linear equations.

### Sampling Streams of Diracs: Numerical Example

Pier Luigi Dragotti Parametric Sparse Sampling and its Applications in Neuroscience and Sensor Networks

### Sampling Streams of Diracs: Numerical Example

Pier Luigi Dragotti Parametric Sparse Sampling and its Applications in Neuroscience and Sensor Networks ) < C

### Note on the proof

Linear vs Non-linear

- Problem is **Non-linear** in  $t_k$ , but **linear** in  $x_k$  given  $t_k$
- The key to the solution is the separability of the non-linear from the linear problem using the annihilating filter.

The proof is based on a constructive algorithm:

- 1. Given the *N* samples  $y_n$ , compute the moments  $s_m$  using the exponential reproduction formula. In matrix vector form S = CY.
- 2. Solve a  $K \times K$  Toeplitz system to find H(z)
- 3. Find the roots of H(z)
- 4. Solve a  $K \times K$  Vandermonde system to find the  $a_k$

Complexity

- 1. O(KN)
- 2.  $O(K^2)$
- 3.  $O(K^3)$
- 4.  $O(K^2)$

Thus, the algorithm complexity is polynomial with the signation innovation in the signation in the second s

### Sparse Sampling: Extensions

Using variations of Prony's method other signals can be sampled such as for example piecewise sinusoidal signals [BerentDragotti:10].

### Robust and Universal Sparse Sampling

- The acquisition device is arbitrary
- The measurements are noisy
- The noise is additive and i.i.d. Gaussian
- Many robust versions of Prony's method exist (e.g., Cadzow, matrix pencil)

### Approximate Strang-Fix

- How restrictive are the Strang-Fix conditions?
- Assume φ(t) cannot reproduce exponentials, we want to find the coefficients c<sub>n</sub> = c<sub>0</sub>e<sup>jω<sub>m</sub>n</sup> such that:

$$\sum_{n\in\mathbb{Z}}c_n\varphi(t-n)\cong\mathrm{e}^{j\omega_m t}.$$

Approximation error

$$arepsilon(t)=f(t)-e^{j\omega_m t}=\mathrm{e}^{j\omega_m t}\left[1-c_0\sum_{l\in\mathbb{Z}}\hat{arphi}(j\omega_m+j2\pi l)\mathrm{e}^{j2\pi lt}
ight].$$

・ロト ・聞ト ・ヨト ・ヨト

э

▶ We only need  $\hat{\varphi}(j\omega_m + j2\pi I) \cong 0$   $I \in \mathbb{Z} \setminus \{0\}$ , which is satisfied when  $\varphi(t)$  has an essential bandwidth of size  $2\pi$ .

#### Generalised Strang-Fix Conditions

### Approximate Strang-Fix

-

### Approximate Strang-Fix

Assume φ(t) cannot reproduce exponentials, we want to find the coefficients c<sub>n</sub> = c<sub>0</sub>e<sup>jωmn</sup> such that:

$$\sum_{n\in\mathbb{Z}}c_n\varphi(t-n)\cong \mathrm{e}^{j\omega_m t}.$$

Approximation error

$$arepsilon(t) = f(t) - e^{j\omega_m t} = \mathrm{e}^{j\omega_m t} \left[ 1 - c_0 \sum_{I \in \mathbb{Z}} \hat{\varphi}(j\omega_m + j2\pi I) \mathrm{e}^{j2\pi I t} \right]$$

Constant Least-squares approximation

$$c_0 = \hat{\varphi}(j\omega_m)^{-1} \Rightarrow c_n = \hat{\varphi}(j\omega_m)^{-1}e^{j\omega_m n}$$

< A

- 4 B b - 4 B b

• Advantage: only need to know the Fourier transform of  $\varphi(t)$  at  $j\omega_m$ .

### Approximate vs Exact Strang-Fix

Exact

- Any device with unit input response of the form  $\gamma(t) * \beta_{\vec{\alpha}}(t)$  where  $\beta_{\vec{\alpha}}(t)$  is an E-spline of order *L*
- ► The order L and the exponents \(\alpha\_0, \alpha\_1, ..., \alpha\_L\) are decided a-priori and cannot be changed.

Approximate

- Any acquisition device h(t) can be used within this framework
- The essential bandwidth of  $h(t) = \varphi(-t/T)$  must be at most  $2\pi/T$
- ▶ We do not need to know h(t) exactly. We only need to know  $\hat{h}(j\omega_m)$ m = 0, 1, ..., L

(日) (同) (三) (三)

► The number *L* of exponentials reproduced is arbitrary

A = A A = A

### Approximate FRI recovery: Numerical Example

#### Gaussian Kernel

Approximate FRI with the Gaussian kernel. K = 5, N = 61, SNR=25dB. Recovery using the approximate method with  $\alpha_m = j \frac{\pi}{3.5(P+1)}(2m-P)$ ,  $m = 0, \dots, P$  where P + 1 = 21.

#### Imperial College London Approximate Strang-Fix: when 'Mr Approximate' is

伺 ト イヨト イヨト

better than 'Mr Exact'

Retrieving 1000 Diracs with Strang-Fix Kernels

- Retrieve Diracs using a sliding window
- Locations of true Diracs are consistent across windows [Onativia-Uriguen-Dragotti-13]

#### Retrieving 1000 Diracs with Strang-Fix kernels

### Retrieving 1000 Diracs with Strang-Fix Kernels

- K = 1000 Diracs in an interval of 630 seconds,  $N = 10^5$  samples, T = 0.06 and SNR = 10dB
- ▶ 9997 Diracs retrieved with an error  $\epsilon < T/2$
- Average accuracy  $\Delta t = 0.005$ , execution time 105 seconds.

## Application: Image Super-Resolution [BaboulazD:09]

Super-Resolution is a multichannel sampling problem with unknown shifts. Use moments to retrieve the shifts or the geometric transformation between images.

Forty low-resolution and shifted versions of the original.

- The disparity between images has a finite rate of innovation and can be retrieved.
- Accurate registration is achieved by retrieving the continuous moments of the

### Application: Image Super-Resolution

Image super-resolution basic building blocks

### Application: Image Super-Resolution

For each blurred image I(x, y):

• A pixel  $P_{m,n}$  in the blurred image is given by

$$P_{m,n} = \langle I(x,y), \varphi(x/T - n, y/T - m) \rangle,$$

where  $\varphi(t)$  represents the point spread function of the lens.

• We assume  $\varphi(t)$  is a spline that can reproduce polynomials:

$$\sum_{n} \sum_{m} c_{m,n}^{(l,j)} \varphi(x-n,y-m) = x^{l} y^{j} \qquad l = 0, 1, ..., N; j = 0, 1, ..., N.$$

• We retrieve the exact moments of I(x, y) from  $P_{m,n}$ :

$$\tau_{I,j} = \sum_{n} \sum_{m} c_{m,n}^{(I,j)} P_{m,n} = \int \int I(x,y) x^{I} y^{j} dx dy.$$

Given the moments from two or more images, we estimate the geometrical transformation and register them. Notice that moments of up to order three along the x and y coordinates allows the estimation of an affine transformation.
